F O R E W O R D

This publication is the 6th in a series of statistical summaries on Florida vegetables. Through joint efforts of the Bureau of Agricultural Economics, U. S. Department of Agriculture and the Agricultural Economics Department of the University of Florida its scope has been considerably expanded by the inclusion of county production and production costs in specified areas. This cooperation has been in effect since 1945. It is the purpose of this publication to present a summary of the many reports that were issued currently during the season, together with historical data for comparative purposes.

Messrs. J. B. Owens, Agricultural Statistician of the Bureau of Agricultural Economics, U. S. Department of Agriculture and G. N. Rose, Agricultural Economist of the University of Florida assigned to the Orlando office of the Bureau of Agricultural Economics collaborated in the collection and analysis of data for the preparation of regular scheduled estimates of acreage, production, and price of Florida vegetables. Per acre cost of production and returns were made by Donald L. Brooke, Agricultural Economist of the University of Florida. Mr. Rose assembled and edited the publication. Miss Arlene Kruse cut the stencils for the bulletin.

J. C. Townsend, Jr.,
Agricultural Statistician

ACKNOWLEDGEMENTS

We would like to take this occasion to gratefully acknowledge our indebtedness to each person and organization contributing to the development of these data. Their cooperation make these reports possible. With the exception of shipment information, the data contained in this report are estimates and are based on reports by, and interviews with, growers, shippers, marketing associations and organizations, seedsmen, railroad representatives, canners and other processors, the Agricultural Extension Service through its county agricultural agents, the Federal-State Inspection and Market News Services, the Florida State Marketing Bureau, the Florida State Marketing Board, the production and Marketing Administration and other well informed sources.

I N D E X

Each crop carries the following sequence of data by season: Name of crop - Season; Acres for harvest, by Counties; Acreage, production and value; State summary; Acreage and production by counties and areas, 1949-50; Shipping data; Per acre costs and returns. Crops that harvest in more than one season are combined in one total grouping classified as "All" and placed before the breakdown by seasonal groupings.

DEFINITIONS AND EXPLANATIONS

SEASONAL GROUPINGS - In order that competitive production within the State of Florida and the United States may be classified on a National basis under reasonably uniform groups, we have established a National pattern which is based on the most active harvesting periods. These major groups are WINTER, SPRING, SUMMER, and FALL. The WINTER group includes the months of January, February, and March; SPRING includes April, May, and June; SUMMER includes July, August, and September (Florida carries no official summer commercial crops); and FALL includes October, November, and December. These periods are not rigidly fixed and the harvesting period for a particular grouping may extend over into the preceding or following group. However, in arranging our data we have followed these groupings in so far as it is practical. For example, it has been considered practical to carry cabbage, carrots, cauliflower escarole, green peas, and strawberries as one season crops, designating them WINTER since the volume production is harvested generally during January, February, and March. So far, sweet corn has only been carried as a spring crop since the bulk of the crop is harvested during April, May, and June but it is possible winter production can reach the point where it will be necessary to make the estimates on a more seasonal basis. Since some systematic order of grouping is necessary it is deemed best for all concerned to handle our classifications on a National basis even though they may not always agree with some local designations now in use.

PLANTED ACREAGE - The definition for planted acreage is based on a "loss of crop" concept. Estimates of planted acres for any seasonal grouping consist of acres for harvest (see next page) during that particular seasonal group plus any acreage planted for harvest during the season, but which was lost or destroyed and did not produce a crop in the season under consideration. If the acreage is lost and not replanted it is counted as planted. If it is lost but replanted for harvest in the same season as the original acreage would have been harvested, the acreage replanted is not considered as additional acreage planted. However, if the acreage lost is replanted for harvest in a later season, it is considered as planted for both seasons and as acres for harvest only for the latter season.

ACRES FOR HARVEST - This is considered as being all acreage from which a crop could have been harvested had economic conditions (prices, available labor, etc.) warranted the harvest. It includes mature acreage on which the harvest was postponed or delayed too long due to economic reasons and the production lost thereby. Acreage which produces such low yields or poor quality that the crop is not worth picking at any reasonable price is considered as crop failure and is not included in the acreage for harvest. Unharvested acreage which produces yields which would be harvested at reasonable prices is included in acreage for harvest.

ECONOMIC ABANDONMENT - This category includes mature production not harvested because of economic factors, such as low prices, shortage of labor, etc. Such loss of production includes quantities left in fields partially harvested as well as production on acreage abandoned for economic reasons. Acreage abandoned at any stage of growth before maturity will be considered as loss of acreage or crop failure rather than economic abandonment of production.

YIELD - Yield refers to total production of merchantable quality produced on an acre basis and may include some unharvested production left in fields for economic reasons.

PRODUCTION - Total production represents the yield times (X) the acres for harvest. Production of value is that part of the production which was harvested and sold or utilized while in the fresh state and does not include economic abandonment.

UNIT VALUE OR PRICE - All prices used in this report are on an F.O.B. basis or its equivalent, less selling charges. In the case of some commodities which are sold in units other than the one listed, these units are converted into the equivalent of the ones used.

TOTAL VALUE - The total value is the price per unit times (X) the production of valu

CANNED OR PROCESSED ACREAGE AND PRODUCTION - The acreage of vegetables in Florida planted solely for canning and processing purposes during the period covered by this publication has been confined principally to cucumbers for pickles. The acreages of beans and tomatoes, the principal crops canned, are planted primarily for fresh market but during recent years substantial quantities have been canned. In order to conform to the National pattern for recording the fresh and processed production of these two crops, we have shown the equivalent acreage on which this processed production would have been grown and listed the remainder as acreage grown for fresh market production.

COSTS AND RETURNS PER ACRE IN SELECTED AREAS IN FLORIDA - These tables represent the summarization of grower records or estimates of costs and returns per acre from several vegetable crops in the major producing areas of Florida for the 1949-50 season as compiled by the Florida Agricultural Experiment Stations. Both costs and returns are computed on the basis of acreage harvested and weather losses or economic abandonment have not been considered. In so far as possible, growing and harvesting costs have been separated and labor items excluded from costs of materials.
